Business Storytelling with Data – Sales Performance Analysis

Report :

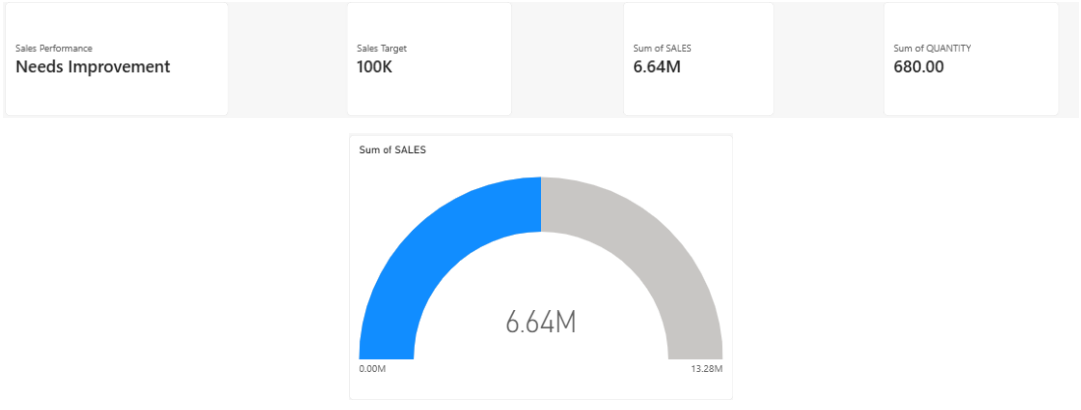

Insight 1: Sales Target Performance

Observation: The dashboard shows total sales of 6.64M from a quantity of 680 units. The Sales Target card shows 100K, yet the Sales Performance card shows “Needs Improvement”. The gauge shows 6.64M on a scale from 0 to 13.28M, so it is filled to about half.

Interpretation: Total sales are far above the 100K target, so the “Needs Improvement” status does not match the numbers on the same page. The 13.28M end of the gauge is exactly double the current sales value, which looks like the default gauge maximum rather than a target. The half-filled gauge should therefore not be read as 50% target achievement.

Recommendation: The business should confirm what period and level the Sales Target refers to, and make sure the Sales Target and Calculated Sales measures are on the same basis. The gauge maximum should be linked to the target so that the performance status, gauge and KPI cards all tell the same story.

Insight 2: Sales Performance by Category

Observation: Home Appliances generates the highest sales of 3.35M (50.5%), followed by Electronics with 1.53M (23.11%) and Furniture with 1.28M (19.27%). Sports contributes 0.24M (3.57%), and Clothing contributes roughly the same small share of about 3.5%.

Interpretation: Home Appliances alone brings in half of all sales, and the top three categories together contribute about 93% of the revenue. Sports and Clothing together add only around 7%, so the business depends heavily on a few high-value categories.

Recommendation: The business should keep enough stock of Home Appliances, Electronics and Furniture to meet demand. It can use discounts, combo offers and seasonal campaigns to lift Sports and Clothing, and reduce its dependence on one category.

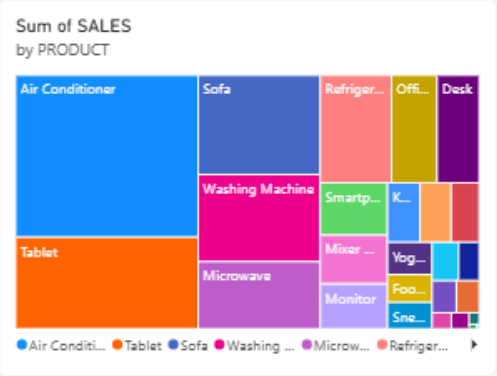

Insight 3: Top Product Performance

Observation: Air Conditioner is the largest product, with approximately 1.7M in sales (about a quarter of the total), followed by Tablet at roughly 0.95M and Sofa at about 0.7M. Washing Machine, Microwave and Refrigerator come next.

Interpretation: The three leading products together bring in about half of the 6.64M total, and four of the six largest products are Home Appliances. This shows that a small group of high-priced products drives the overall revenue.

Recommendation: The business should make sure these best-selling products are always in stock and well promoted. Bundling them with accessories, warranties or related products can increase the value of each sale.

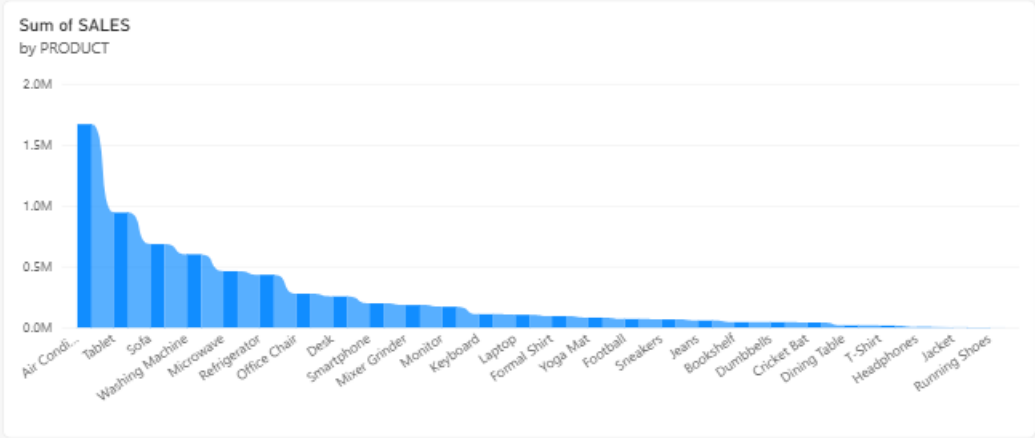

Insight 4: Product Sales Ranking and Long Tail

Observation: Sales fall sharply after the first few products. Air Conditioner is near 1.7M, Tablet near 0.95M and Sofa near 0.7M, while products such as Dining Table, T-Shirt, Headphones, Jacket and Running Shoes contribute close to nothing.

Interpretation: A small number of products creates most of the revenue, while a long list of products adds very little. This means that inventory, marketing effort and shelf space are spread over many items that give a low return.

Recommendation: The business should review the low-selling products and decide whether to promote them, bundle them with popular items, or reduce their stock. The effort saved can be used on products that already perform well.

Insight 5: Discount and Profit Analysis

Observation: The two products with the highest profit, about 0.45M and 0.3M, both sit at a discount value of around 0.2. Most products with discount values of 0.4 to 0.7 earn less than 0.1M in profit. One product at a discount value of about 1.15 earns around 0.2M.

Interpretation: Higher discounts do not automatically lead to higher profit. The most profitable products are sold with moderate discounts, while many heavily discounted products earn little. The chart uses the sum of discount, so a high value may also reflect a large number of transactions rather than a deeper discount per sale.

Recommendation: The business should keep discounts moderate on its high-profit products and review the products with high discounts and low profit. Using the average discount per product instead of the sum will give a clearer picture for future decisions.
